

Problems using Zabbix

When using Zabbix and the Local server that we connect for index.php and the front end of zabbix, the apache2 server gives me an error and I can not start it so that I can enter the <http://127.0.0.1/zabbix> .

Job for apache2.service failed. See "systemctl status apache2.service" and "journalctl -xe" for details.

I found that the problem is due to a file error `/etc/apache2/apache2.conf`

Where should I add it

Serverhost localhost which did not work.

I also uninstalled and reinstalled the apache2 server but it still gives me FAILURE.

This error had occurred the previous time[Z3001] connection to database 'zabbix_db' failed: [1045] Access denied for user 'zabbix' @ 'localhost' (using password: YES)

and I managed to fix it by teasing the files

`/etc/zabbix/zabbix_server.conf` and

`zabbix.conf.php` to have the same information, specifically the same host.

The final problem is that I have to constantly uninstall and reinstall the whole zabbix in order to be able to enter the local website and do tracking.
